#### 1. Weather and Rainfall Condition

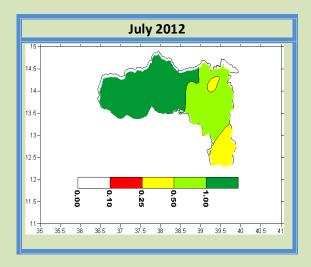

## 1.1 Kiremt Season (June - September 2012) Assessment:

**A. Onset:** Rainfall onset for Kiremt season, generally, was during the month of June. Onset for Southern, Southeastern, and much of Eastern Tigray was between 15 and 20 June 2012. The onset for most of the Western half of Tigray was much more dominantly before June 15 while for Northwestern areas it was before June 11.

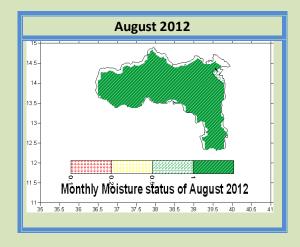

**B. June:** During the month of June, the tip of South Eastern Tigray was very dry (< 0.1). Whereas most parts of the Southern, South Eastern, Eastern and Central parts experienced dry to moist condition (> 0.1 and < 1). Much of the North Western and Eastern parts of Tigray were covered by humid moisture.

**C. July:** As shown in the chart below, during the month of July, **m**ost areas of Southern region and pocket areas of Eastern region received moderate moisture (0.02 - 0.50) while majority of South Eastern and Eastern part of the region exhibited moist condition (0.5 - 1). Some of the North Eastern and majority of the Western region of Tigray were dominantly covered by humid moisture conditions (>1.0).

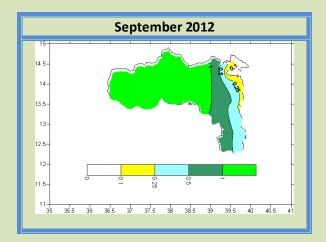

**D.** August: Moisture status of the month of August for the entire region as shown in Chart below showed that humid condition was exhibited while in some parts of the region moist and moderately dry to moist condition were observed. During this particular month heavy rains and flooding did occur in some parts of the region resulting in some undesirable conditions such as water logging, crop damage and soil erosion.

**E. September**: The boundary areas of Eastern region exhibited dry conditions but this particular region received little moisture precipitation that was helpful for pastureland (< 0.1). Most areas of Southern, South Eastern and

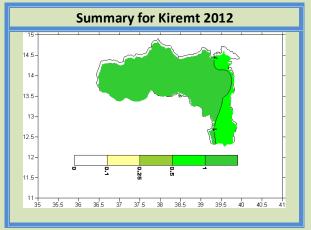

pockets of Eastern region experienced from moderately dry to moist conditions of moisture status (0.1-0.5) while North Eastern and Western region exhibited humid condition.

**F. Cessation:** Cessation for Kiremt was before September 5 and within the end of the month of August for Southern and much of Eastern Tigray. Rainfall cessation for most of Southeastern and small area of Eastern Tigray was between 05 and 10 September. Rainfall cessation for Western half of Tigray was dominantly after September 15, while for the other Western half was before June 15. Cessation for Southern, Southeastern, and much of Eastern Tigray was between 15 and 20 June 2012.

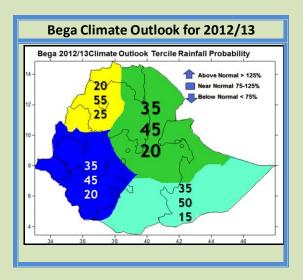

**G. Summary of Kiremt Season**: Generally most area of Tigray region experienced humid condition that was favorable for crop production, pasture lands and as a source of drinking water for humans and animals. However, there has been water logging effects due to heavy rains. Hailstorms damaged crops in some pocket areas of the region. Few parts of the southern and tip of the Eastern region exhibited moist conditions of moisture status. Western half of Tigray was dominated by humid conditions. Most of the Western, Central and North Western regions of

Tigray were covered by humid moisture conditions.

Key= (0-0.1-Very dry, 0.1-0.25- dry, 0.25-0.5 - moist, 0.5-1-humid and > 1.0 – Wet condition)

1.2 Climate Outlook for Bega (September -**January 2012)**: The 2006/7 and 2009/10 Analogue years were used to predict climate outlook for Bega season. During October of the two analogue years, the observed moist moisture status had positive impact for Meher agricultural activities but the same analogue years had a negative impact on harvest where crops did not attained maturity stage in full. But the same season was beneficial for the availability of pasture and drinking water for agro pastoral areas of the region. This moisture availability was much favored over the Western half of Tigray, the rest was moderately dry. During the month of November, there was no moisture at all, it was very dry condition. In December, little moist condition exhibited over South but the rest region was dry. During January, there was no moisture registered at all and it was dry to very dry condition. However, the condition was beneficial for the availability of pasture and drinking water for agro pastoral areas in the months of October through January.

Tigray region, as shown in the map, is shaded with Yellow and Green.

**Yellow Areas** or north-western zone; there is a 55 percent probability of normal rainfall in the western parts of Tigray, Amhara and Northern Beni-shangul Gumuz with an 80 percent probability of normal to below normal rain.

Green Areas or north-eastern; There is a 45 percent probability of normal rainfall in Afar, eastern Tigray, eastern Amhara, northern Somali, Eastern and central Oromia with an 80 percent probability of normal to above normal rainfall. As noted, this might negatively affect harvesting in the cropping areas of Eastern Tigray Amhara and central and east Oromia regions

Dark Blue Areas or south-western; There is a 45 percent probability of normal rains in most of SNNP, Gambella, western Oromia and southern Beni-shangulg Gumuz with an 80 percent probability of normal to above normal rainfall. The rains are forecast to have the dual effect of increasing water availability for late planted crops but also potentially adversely impacting on harvested crops that remain in-field:

Light Green Areas or South & south-eastern; There is a 50 percent probability of normal rains in southern Oromia and southern and southeastern Somali Region with an 85 percent probability of normal to above normal rainfall during the hagaya/ deyr rain. This is forecast to improve pasture and water availability and transition the area to the recovery phase of the drought cycle.

Day time temperatures are forecast to be characteristically high and nighttime temperatures will be low. Frost is forecast for high and exposed areas in the northeastern, central, eastern and southern highlands

Conclusion: Bega seasons of the analogue years had indicated relatively good moisture status and small increment in WRSI & vegetation cover, particularly on the months of October & November. Bega season is expected to favor for those not fully matured Meher crops, late sown pulses & oils perennial plants and pasture and water.

The situation confirmed by seasonal probabilistic forecast had given near normal rainfall distribution which is more/less likely to occur over much of the entire region especially over the Western half of Tigray. The anticipated probability of normal to very little extent of above normal rainfall is expected in most Meher growing areas of southern, eastern as well as southeastern & some central Tigray. It is expected to have negative impact on meher harvesting activity, crop pests & diseases. Thus, harvest and post harvest activities should be undertaken on time in order to avoid unnecessary harvest and post harvest loses. This season is expected to have positive impact on agro-pastoral activities. Care should be taken during harvest and post-harvest activities in order to minimize harvest losses due to

excessive moisture & unseasonal rain. It is also advisable to properly utilize moisture obtained from this season to boost pasture and dirking water availability. The anticipated low probability of occurrence of frost in frost prone areas will create favorable condition for the normal growth and development of plants in the areas. Generally, Bega season is going to start in October and it will be much sunnier and dry season.

2. Hazards: During Kiremti season, Ahferom, Kilte Awlaelo, Raya Azebo and Irob Woredas were hit hard by various hazards. Nine Tabias (Kebles) of Ahferom Woreda was affected by flood. One hundred and fifty eight households or 790 people were seriously affected. A total of 1623 hectares (planted, irrigated, fruit area, nursery and others) of land was seriously damaged and out of use. 474 Blankets and Plastic sheets were distributed by EWRFSS to assist them cover themselves and build temporary shelters.

One Tabia (Kebele) of Kilte Awlaelo Woreda was engulfed by heavy rain and hailstorm. A total of 1009 people were seriously affected and about 2789 hectares of land was damaged. A total of 57.6 MT (equivalent to 578353 birr) of various seeds (Chickpea, Vetch and Wheat) were supplied by world vision in form of credit (revolving fund) and distributed to those affected target beneficiaries to assist them replant the field.

Almost the entire population of Raya Azebo and Irob Woreda were also seriously affected by drought. Various seeds were distributed to assist them replant their field; however, due to complete failure of Azmera and Kiremti rains, the expected harvest from these two Woredas is very insignificant as compared to the projected plan and hectare of land planted.

(Please refer to the summary of mid meher assessment result in Annex I)

**3. Mid Meher Assessment**: Mid meher assessment were carried out to assess crop performance in 12 Woredas (refer to Annex I for the name list and production projection) of South, East, Central and North eastern zones of Tigray regional state between 04 and 27 September 2005 EC. Selection of these particular Woredas was based on crop performance reports and signs of different hazards (hailstorm, flood, pest and weeds).

The objective of the assessment was to create conducive environment for the upcoming final meher assessment by informing Woreda experts and other key stakeholders to prepare the necessary information and data for the upcoming mission, to assess the impact of a particular disaster, if any and to evaluate the extent to which households can cope with.

Assessment results have indicated that performance of azmera rains was poor since the onset in most of these Woredas was late. In some Woredas, azmera rain started early with some irregularities. The onset of Tsedia rains of the assessed Woredas; however, was normal as compared to the reference or normal year. With the exception of few woredas, the onset was on first week of June, which was almost normal in most of the visited Woredas. Following the onset of Tsedia rains the amount and distribution of rain was normal in most of the Woredas except Raya Aazebo and Irob and some pocket areas, but dry spells was observed during the month of July for about the first two weeks that had an influence on crop performance. In areas where azmera rains were poor, farmers had opted to shift from planting long to short cycle crops.

Land preparation for both Azmera and Kiremt/Tsedia crop was reportedly poor in most of the visited woredas due to delay of Azmera rains. It resulted in poor crop performance as a result of weed infestation and pest damages. But time of planting during the Kiremti or Tsediya rains were normal in most of the visited Woredas.

Major staple crops planted in azmera include Sorghum, Teff, Millet and Maize while crops such as Barely, Wheat, Teff and Pulses are planted mainly during Kiremt/Tsediya. Teff, Wheat, Pulses and vegetables such as onion and pepper were also used as source of income (cash crop) in most visited Woredas.

Supply of agricultural input (fertilizer, improved variety of seeds and other chemicals) was good compared to last year but due to dry spell and late plantation of long cycle crops, utilization of these inputs were reduced. As a result, the total annual crop production, in most of the visited Woredas is expected to yield less. Some pocket areas of the region were also hit hard by hailstorm, flood, shortage of rain fall, weeds and diseases and pests.

Result of the assessment has also indicated that there has been an improvement on water and pasture. The physical condition of the Livestock in all visited Woredas was normal. There was no unusual livestock disease outbreak and death in most visited Woredas. However, in some weredas such as Hawzen, foot and mouth disease (FMD) outbreak was observed although the situation was managed by experts and the communities.

Supply of staple foods and livestock in most of the markets were normal. Price of cereals, especially Teff, on the other hand showed slight increment and price of pulses decreased slightly as compared with same month of last year. Price of livestock showed significant increment due to increased demands. Income from livestock sales and livestock products is good due to availability of water and pasture. Other sources of income such as agricultural labor have significantly increased.

In 12 assessed Woredas, a total 260,162 ha of land was planned to be cultivated and the expected harvest were 1,070,485.5 MT. Out of these hectare, 249,922 (96%) was cultivated during 2004/5 meher season and during the assessment time, it was estimated a total of 714,613.3 (67%) MT of grain was expected to be harvested.

Generally speaking, production prospect of meher season is expected to be poor as compared last year due to the long dry spells, and uneven distribution of rain of the Azmera and kiremt/Tsediya rains in all visited Woredas. Some pocket areas managed to plant long cycle crops such as Sorghum, Millet and Maize but they are in poor condition due to poor performance of azmera rains and late plantation.

Food security status of Raya Azebo and Irob Woredas, as shown in Annex I, however, is in critical condition. Due to failure of azmera and kiremti rains, production prospect of the two Woredas has decline significantly. As compared to the revised plan, only about 18 and 16 percent of the total production prospect is expected to be harvested in Raya Azebo and Irob Woredas respectively. In fact, result from the assessment has indicated that it could even be less because this prospect was calculated hoping that the cessation of kiremt rains will be normal but in most visited Woredas (95%) the rains ceased early.

Table 1: Hectare of land planted versus planned

| Woreda       | Ref. Y  | ear         | Last Year |             |  |
|--------------|---------|-------------|-----------|-------------|--|
|              | Planted | Change in % | Planted   | Change in % |  |
| Alaje        | 5.5     | 0           | 92.5      | 0           |  |
| Endamehoni   | 625     | 20          | 296       | 42          |  |
| Raya Alamata | 5268    | 78          | 2242      | 184         |  |
| Raya Azebo   | 4484    | 154         | 1194      | 577         |  |
| Ofla         | 2915    | 34          | 1476      | 67          |  |
| Hintalo      |         | 0           | 102.9     | 0           |  |
| Wajirat      | 139     |             |           |             |  |
| Total        | 13437   | 90          | 5403      | 224         |  |

**4. Market Assessment:** Market price for 9 months (January to September 2012) from four big and well known market sites (Raya, Hawzen, Kola Tembien and Tahetay Koraro), representing South, North, Central, East and West Zones of Tigray regional state, were collected and analysed.

Key parameters (crops and livestock) of each livelihood zone were selected for market price and trend analysis. The market price and trend analysis have shown that both crops and livestock price have increased ranging from 2.0 to 76.7 percent. The price increment for Teff, Sorghum, Ox and Shoats in Raya have increased by 27.5, 42.6, 29.9 and 33.9 precent respectively.

The Price increment for Barley, Wheat and Sheep in Hawzen Market are 27.8, 2.0 and 60.6 respectively. The Price increment for Teff, Sorghum, Goat and Cow in Kola Tembien market are 52.9, 39.1, 35.4 and 76.7 respectively. The price increment for Teff, Maize, Sheep and Goat in Tahtay Koraro market are 49.8, 28.2, -9.6 and -0.6 respectivley.

The mean price increment of crops and livestock were 30.0 and 21.7 percent respectivley. The average price increment of Teff and Sheep scored the higest figure, which is 43.3 and 28.3 percent respectively, while price of Ox (10.0%) and Crops such as Wheat, Barely and Maize (19.3%) scored lower. (Please refer to Annex VI for the price increment of each commodity being assessed in four markets sites)

The price incerment trend alalysis for each market sites were also assessed. The result has shown that the highest price increment in Raya was Sorghum (42.6%), in Hawzen was Sheep (60.6%), in Tahitay Koraro was Teff (49.8%) and in Kola Tembien was Cow (76.6%). The price of Sheep and Goat in Tahitay Koraro; however, showed decline of 9.0 and 0.6 precent respectively.

<u>Chart 1: Average Price incerment of commodities</u> <u>& # of Market sites Assessed.</u>

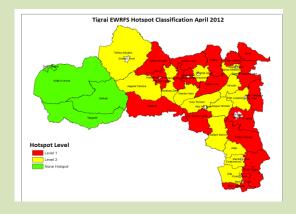

As shown in Chart 1, the average price increment of Teff in three markets sites showed 43.4%, while that of Sheep was 28.3%. However, the price increment of Cow and Ox in one market site showed the least price increment.

**5. Interventions:** A number of emergency and developmental projects/ programs are being implemented by the government and key

stakeholders to support beneficiaries in need of food assistance. The major interventions or programmes being implemented during the first quarter include among others;

- ✓ Productive Safety Net Program (PSNP)
- ✓ General Food Distribution (GFD)
- ✓ Therapeutics Feeding Program (TFP): either (Outpatient Therapeutic Feeding Program (OTP) or Therapeutic Feeding Unit (TFU) or Stabilization Centre(SC)
- √ Targeted Supplementary Feeding (TSF)
- ✓ Community Health Days (CHD)
- ✓ And other programmes such as CBN, Social Protection, IGA etc

**5.1 Hotspot Classification**: Out of the 34 Rural Woredas of Tigray regional states, the total number of Woredas classified and determined as hotspot priority number one and two are 16 and 15 respectively.

Three Woredas are classified as not hotspot. The classification and determination of hotspot Woredas were done by regional and federal DRMFSS based on the agreed up on food security status or hotspot classification criteria reflected in Annex VII. However, hotspot Woreda classification has been revised in September and the list of hotspot Woredas will officially be released and shared with key stakeholders soon.

Table 2: Program or Intervention Coverage

|        | Hotspot<br>Priority #1 | Hotspot<br>Priority # 2 | Non Hotspots | Total | Coverage % |
|--------|------------------------|-------------------------|--------------|-------|------------|
| Woreda | 16                     | 15                      | 3            | 34    | 100        |
| TFU/SC | 10                     | 7                       | 1            | 18    | 53         |
| ОТР    | 16                     | 15                      | 3            | 34    | 100        |
| TSF    | 16                     | 1                       | 0            | 17    | 50         |
| CBN    | 16                     | 15                      | 3            | 34    | 100        |
| CHD    | 16                     | 15                      | 3            | 34    | 100        |
| GFD    | 16                     | 15                      | 0            | 31    | 91.2       |

The coverage of the OTP, CBN and CHD programme or interventions in the region scored 100 percent. GFD coverage in the region reached 91.2 percent. All (16) Woredas classified as hotspot priority number one are receiving complete service of OTP, TSF, CBN and GFD interventions. Therapeutics Feeding Unit (TFU) and Targeted Supplementary Program (TSF) programmes in the region scored 53 and 50 percent respectively.

#### 5.2 Productive Safety Net Program (PSNP):

Contingency budget was used during this quarter to support PSNP beneficiaries in the region since the main budget usually ends in June. Both in kind (grain) and cash were used to support target beneficiaries. A total of 69,449,590 Ethiopian birr were allocated and disbursed to 515,431 target beneficiaries form 14 Woredas in the month of July and August. 65.41 Metric Tons of Wheat were also distributed to 359,906 PSNP beneficiaries from six Woredas (five and one Woreda benefited for one and two months respectively).

A total of 304,327,840 Ethiopian birr has been allocated for 2005 to benefit 1,238,677 beneficiaries during first round plan (September – November 2005).

The total number of target beneficiaries who will be participating in public work will reach 1,044,799 while 193,878 will be entitled for direct support.

**5.3. Relief /Emergency Beneficiaries**: A total of 758,257 beneficiaries received 140,434 MT of relief foods this quarter. Wheat 15kg, Vegetable Oil 0.5kg, Pulses 1.5kg were given on monthly

basis to relief beneficiaries and W/CSB 4.5 kg were distributed for 35% of total beneficiaries during this quarter.

Table 3: Relief Beneficiaries and Amount of food distributed

| Month     | Implementing Organization | Number of Beneficiaries | MT of food<br>Distributed | Remark                  |

#### 5.4 Community Health Days (CHD)

September 2005 CHD Screening Result: A total of 532,593 children aged 6 -59 months were screened during 21 -25 September 2005 E.C from 786 Kebeles (Tabias) of 34 rural Woredas and 12 towns of Tigray regional state.

The screen coverage was 82.3 percent with moderate and severe wasting rate of 6.7 and 0.71 respectively. A total of 103 (0.02%) cases of bilateral edema were detected. During this exercise, the highest top three malnutrition rate was recorded in Ganta Afeshum (19.2%), Enderta and Korem Town with Global Acute Malnutrition (GAM) level of 19.2, 16.8 and 16.8 percent respectively.

The top three oedematic cases were recorded in Naeder Adiet, Laelay Maichew and Degua Tembien with 20, 9 and 8 cases respectively (See Table X Annex III).

The CHD screening exercises for pregnant and lactating mothers were also carried out to determine their nutritional status. A total of 100, 765 Pregnant and Lactating Mothers (PLM) were screened using MUAC. The screening coverage was 59.3% that shows an indication of low screening coverage which needs special attention to improve it.

The CHD report for PLM has indicated that both moderate and severe cases were 18.7%. As far as the PLM malnutrition level is concerned, Erob, Adigrat and Adwa town scored the top three with a value of 49.6, 38.9 and 37.4 percent respectively.

As compared with June screening results, screening coverage of PLM for September has increased by 1.85 percent only. Since December 2011, four screening were conducted to determine malnutrition level of PLM, September screening has the top coverage results. (Please refer to Annex IV)

**Table 4: Annual Regional CHD Screening Summary Result for PLM** MUAC <2 Coverage Total Screened Month December 2011 97442 54.40 21779 22.40 March 2012 99133 55.93 20541 20.54 June 2012 98936 53.50 19119 19.33 September 2012 100765 59.30 3 18796 18.70

#### 5.5 Outpatient Therapeutic Program (OTP)

**Total / Average** 

July - September 2012: The monthly TFP monitoring reports collected from the six zones of Tigray regional state (Southern, South eastern, Eastern, Central, North western and Western) has indicated that a total of 3,707 children form 775 TFP sites were admitted to the program. The reporting rate for this quarter has reached 89.3 percent. On average, the cure, death and defaulter rate of this quarter was 68.1, 1.0 and 5.3 percent respectively. There were 119 (3.2%) Non respondent and 100 (2.7%) medical transfer cases reported. The total number of children discharged reached 3221 (86.9%).

**ADMISSION** Nb of TFP Mortality rate % ▲ Defaulter rate% Report completion rate % % Cure 1800 100% 1571 90% 1600 1427 80% 1400 1165 70% 1200 948 60% 922 1000 885 7C 769 775 708 769 50% 686 71691 695 696 708 800 40% 600 30% 400 20% 200 10% May

Chart 2: Admission, Cure, Death and Default Trends of TFP for 2012

Admission in July hit 1427 and showed a marked decrease in August (709) but significantly increased in September (1571) this could be due to mass mobilization, screening exercise and referrals being conducted during the same month. Besides, the expansion of TFP sites from 769 in July and August to 775 in September could contribute to the rise of the figure. Cure rate started at 77.5% in July and showed an increasing trend in August (81.1%) then decreased to 75.3 percent in September. The reporting rate for the month of July, August and September showed 89.1, 89.5 and 89.4 percent respectively.

TFP Admission is expected to stabilize or decrease in the upcoming or second quarter following the Meher harvest and ending of the hanger season.

<u>January</u> – <u>September</u> <u>2012</u> <u>Trends</u>: As of January 2012 the number of TFP sites has increased by 13 percent. The reporting rate has shown a steady and slight increment since January but the cure rate has showed a slight decline, it started with 79.5 percent in January

ending with 75.3 percent in September. Defaulter rate for January, February, April and July were above 6 percent, especially for July it has reached its peak (7.2%) but for the month of March, May, June, August and September were below 6 percent, especially for September it was rated the lowest (5.3%). This figure showed there has been an improved result in terms of managing children defaulting from the program.

**5.6 Targeted Supplementary Feeding (TSF) Program:** The total number of Woredas entitled to receive Targeted Supplementary Feeding (TSF) program for first quarter were 17, out of which 16 are categorized as hotspot priority number one (please refer to the Region's map to see the names of the Woredas) and the remaining one is an Millennium Development Goal (MDG) project Woreda. The total numbers of children aged 6 to 59 months supported by TSF program are 19,055 (48.8% male and 51.2% females) and 10,170 pregnant and lactating mothers bringing to a total of 29,225 target beneficiaries. A total of 572.72 MT of food

(497.9 of Corn Soybean Blend (CSB) and 74.8 MT of vegetable oil were distributed and reached the above stipulated target beneficiaries during this quarter.

The new generation TSF is building the capacity of key partner organization to effectively and efficiently implement its program. Starting from the month of July through September 2012, a total of 372 (167 males and 205 females) were trained. The Integrated Refresher Training (IRT) covered various important topics such as the over view of TSF program, concepts of nutrition and malnutrition, implementation modalities of new generation TSF, duties and responsibilities of implementing partners at different levels, expected outcome and impact, lessons learned, challenges, and way forward. Focal persons from Zone, Wereda, Tabia and Kushets from various sectors such as health, agriculture and administration officials, TSF focal persons, health extension workers, supervisors, health heads/medical center directors, distribution agents, area coordinators and chair persons were the key actors of the program participated in the workshop or training. The main purpose of the IRT is to provide training of trainers (TOT) to the key focal persons at different levels and these trainees are expected to cascade the same training to Woreda and down to the grass root level to bring improvements in the implementation of the TSF program.

The TSF program is expected to scale up or expand its implementation to other eight Woredas, namely Tahitay Maichew, WerieLeke, Ahferom, Ganta Afeshum, Degua Tembien, Enderta, Atsbi Wenberta and Laelay Maichew Woredas in the month of October through December to reach additional or significant number of target beneficiaries, particularly

children under five and pregnant and lactating mothers. Necessary preparation is under way to provide IRT (ToT) to focal persons of key governmental and nongovernmental organizations.

The two major challenges that had encountered throughout the implementation of TSF program during the first quarter is logistic issue and delay of sharing CHD results from RHB. The extended delay of dispatch and distribution of TSF food to target beneficiaries due to transportation problem was one of the stumbling blocks of the program. Getting potential candidate capable of transporting TSF foods from main warehouse to distribution sites (Tabias or Kebeles) was a serious problem in the region that needs immediate attention and the involvement of the concerned authorities in the region. Delay in sharing CHD screening results from RHB has also its contribution in enrolling target beneficiaries to start the program with in short period of time was also one challenge that needs further attention and improvment. The TSF food was not distributed to target beneficiaries within 21 days after the completion of screening as clearly stipulated in the protocol. In some Woredas, the moderately malnourished children and pregnant and lactating mothers did not receive the TSF food or the necessary support until after two or three CHD screenings. At the moment, BoARD had managed to sign memorandum of understanding with Relief Society of Tigray (REST) to overcome or manage this particular problem. REST is expected to transport TSF food from WFP main warehouse to distribution sites (Tabias or Kebeles) to reach the vulnerable group of particular communities classified as hotspot priority number one.

#### 6. Capacity Building

**6.1 Meeting / Workshop**: Between the month of July and September 2012, three Multi Agency Nutrition Task Force (MANTF) and Agricultural Task Force (ATF) monthly meetings were conducted. The monthly meeting were hosted and facilitated by regional Heath Bureau and Bureau of Agriculture and Rural Development respectively. ATF meetings have financially supported by Food and Agricultural (FAO). The Organization objective establishing the above stipulated task force is to create a platform that brings key stakeholders in one table on regular basis and share hands on experience and information timely to discuss about early and late signs of early warning indicators, mobilize resources and respond to particular needs swiftly and to mitigate and manage any disaster as well as designing and implementing long term sustainable programmes.

#### 7. Challenges

A. Budget Release and Transfer: The release and transfer of funds from UNICEF to EWRFSS for the first quarter (that is expected to cover activities from July – September 2012) reached in 18 October 2012. The release of funds from UNICEF to BoFED and the transfer of the same fund from BoFED to EWRFSS took extended period of time. Although the notification letter had reached EWRFSS in October 01 2012, the actual transfer of funds from UNICEF Addis Ababa to BoFED Tigray regional state and from

BoFED to EWRFSS account took another ten working days. The first quarter had passed with no or minimal financial support, as a result the major activities projected for first quarter was not implemented.

- **B. Data Analysis**: There had been a recruitment process initiated by the early warning office in collaboration with the DRMFSS, however, the position for the data analyst still remains vacant. Therefore, the recording and analysis of early warning data has not been possible at full scale.
- **8. Upcoming Events:** Some of the major activities planned for second quarter (October December 2012) include among others;
- **A. Training**: Training of Trainers (ToT) on Emergency Nutrition Assessment based SMART methodology will be conducted. Health and Early warning experts from around 24 Wordas of Tigray will benefit from this five days training. Training of Disaster Risk Reduction (DRR) for 25 regional and woreda level officials and experts for two days is expected to be conducted.
- **B. Meeting**: A monthly Multi Agency Nutrition Task Force (MANTF) and Agricultural Task Force (ATF) or Disaster Risk Management (DRM) Task Force meetings will be carried out.
- C. Quarterly Review Meeting: One quarterly review meeting for Woreda EW experts at regional level is expected to be carried out during this quarter.

Annexes

#### Annex VI: Regional Representative Market Samples and Trends for 9 months A. Raya Market **B.**Hawzen Market Teff Sorghum — Ox — Shoats Wheat Sheep — 1,000 **B.** Kola Tembien Market **C.T/Koraro Market** Teff Maize — Sheep — Goat Teff Sorghum Goat ——Cow

#### **Annex VII: Hotspot Woredas Classification Criteria**

#### Priority One (Worst Affected)

#### **Health/Nutrition:**

Excessive and widespread morbidity and/or disease outbreak e.g. diarrhoea disease, AWD, Malaria etc

Under five mortality rate > 2/10000/day or Crude Mortality Rate (CMR) 1-2/10000/day

Global Acute Malnutrition (GAM) prevalence ≥ 15% with aggravating factors

Very high admission of children under five to TFP, reports of high level of acute malnutrition verified from clinical records

Consumption of health-threatening famine foods

#### Agriculture:

Widespread / very high death of livestock

Widespread consumption of seeds

Widespread infestation of crop pests or disease

Emaciated body condition of livestock

#### Market:

Excessive distress sale of productive livestock (oxen, milking cow, female camels – productive assets)

Serious market inaccessibility; extremely high staple food prices; extremely low market supply of staple foods, very high decline in terms of trade

#### **Education:**

Very high increase in school dropouts (above 5% dropout rates related to food security problems)

#### Water.

Critical shortage of water for both human and livestock consumption

#### Others:

Distress migration of entire households in search of food

Disruption of livelihoods and normal functions of the community's social services by manmade and natural causes Widespread increase in begging, stealing or other demeaning occupations due to food security related problems

#### **Second Priority (Close Monitoring)**

#### *Health/Nutrition:*

High admission of under five children to TFP, reports of acute malnutrition verified from clinical records of children under five mortality rate 1- 2/10000/day or Crude Mortality Rate (CMR) 0.5-1/10000/day

Global Acute Malnutrition (GAM) prevalence 10-14% with aggravating factors

High morbidity and/or disease outbreak e.g. diarrhoea disease, AWD, Malaria etc

#### Agriculture:

Increased / high death of livestock

Consumption of seeds by considerable number of households

High infestation of crop pests or disease

Thin or very weak condition of livestock

#### Market:

Unusual increase /high/ sales of livestock (oxen, milking cow, female camels – productive assets)

High market inaccessibility and very high staple food prices; very low market supply of staple foods

Very high market supply and very low livestock price, significant decline in terms of trade

#### **Education:**

High school dropouts (above 2-5% dropout rates related to food security problems)

#### Water:

Serious shortage of water for both human and livestock consumption

#### Others:

Migration of some members of households in search of food

Increased begging, stealing or other demeaning occupations due to food security related problems

Significance disruption of livelihoods by manmade or natural causes and normal functions of the community's social services by manmade and natural causes

#### Priority Three (Normal)

#### **Health/Nutrition:**

Global Acute Malnutrition (GAM) prevalence 5 -9% with aggravating factors

Under five mortality rate < 1/10000/day or Crude Mortality Rate (CMR) 0.5/10000/day general population

#### Agriculture:

Moderate shortage of pasture

Poor body condition of livestock

Low infestation of crop pests or disease

Thin or very weak condition of livestock

#### Market:

Moderate increase in staple food prices; low market supply of staple foods, decline in wage labour rates. Decline in livestock price and decline, decline in terms of trade

#### Water:

Moderate shortage of water for both human and livestock consumption

#### Others:

Increase in fire wood collection and charcoal making resulting in decline in prices

Request of relief assistance from local authorities or community members
